Mobile FOWTs to Power Oil & Gas Facilities to Reduce CO₂ Emissions

Yusuf Arikan

March 30, 2023

Background

- Like most developed countries, in 2019, the government of Canada set a price on carbon pollution across the country.
- CO₂ emission costs \$50/tonne with prices increasing \$15 per year until 2030 when it hits \$170/tonne
- There is significant Oil & Gas exploration and production activity on the east coast of Canada
- Oil & Gas facilities use generators that consume hydrocarbons and release CO₂ for electricity

Background

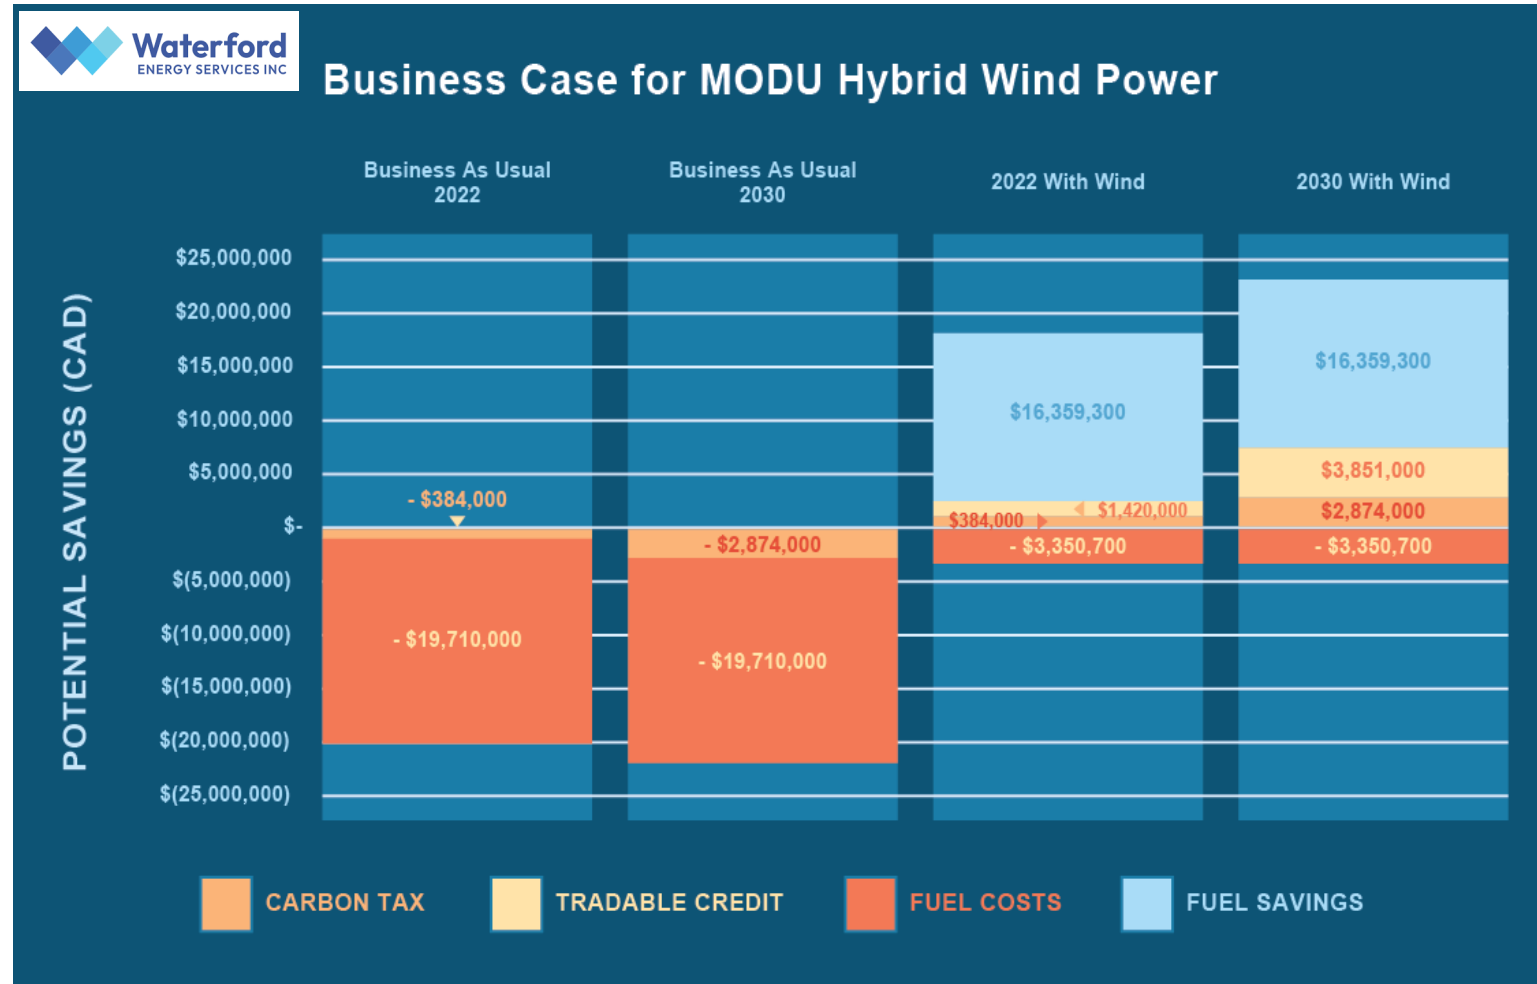

- Canadian Carbon Tax
 - Carbon tax on all combusted fossil fuels
 - 30% reduction of GHG emissions below 2005 levels by 2030
- MODU (mobile drilling units) produce approximately 40,000 tonnes of CO₂ annually
- Floating Offshore Wind Turbines (FOWTs) can reduce CO₂ emissions to 7,000 tonnes, an 83% reduction in emission and fuel costs

Background

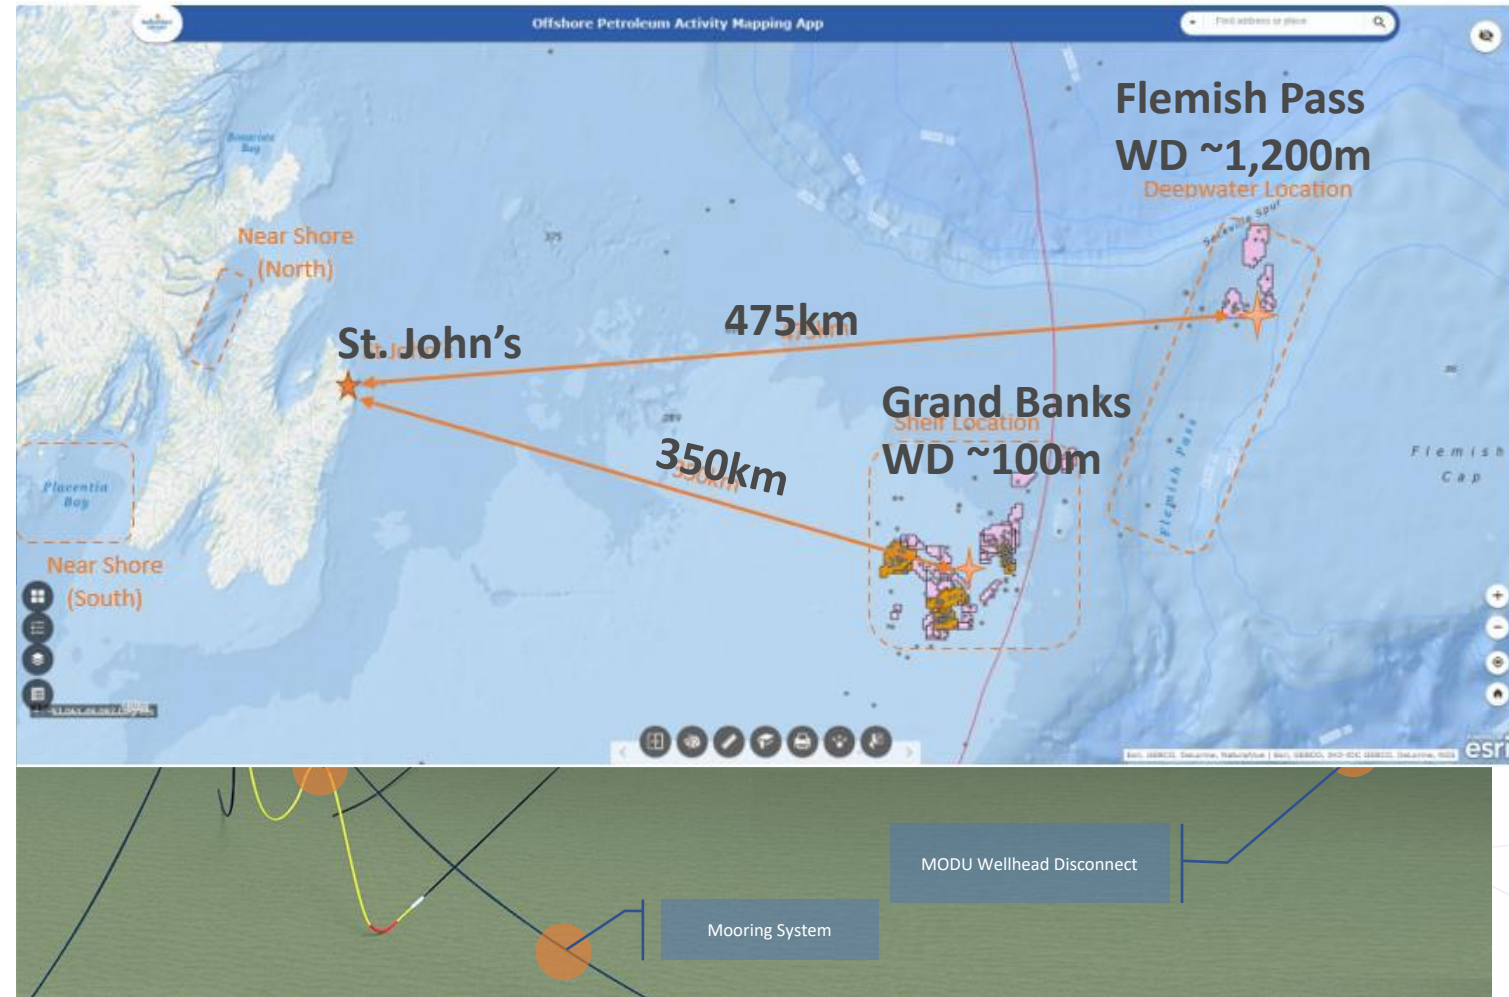

- Annual Savings with FOWT - 2030
 - \$2.8 million on carbon tax
 - \$3.8 million tradable credits
 - \$16.3 million fuel savings
- The fuel savings for MODUs vary based on the BESS capacity, As BESS increases, the generator loads decrease and create additional cost savings on fuel and emissions tax.

Study – Feasibility of FOWTs to Power Oil & Gas Facilities to Reduce CO2 Emissions

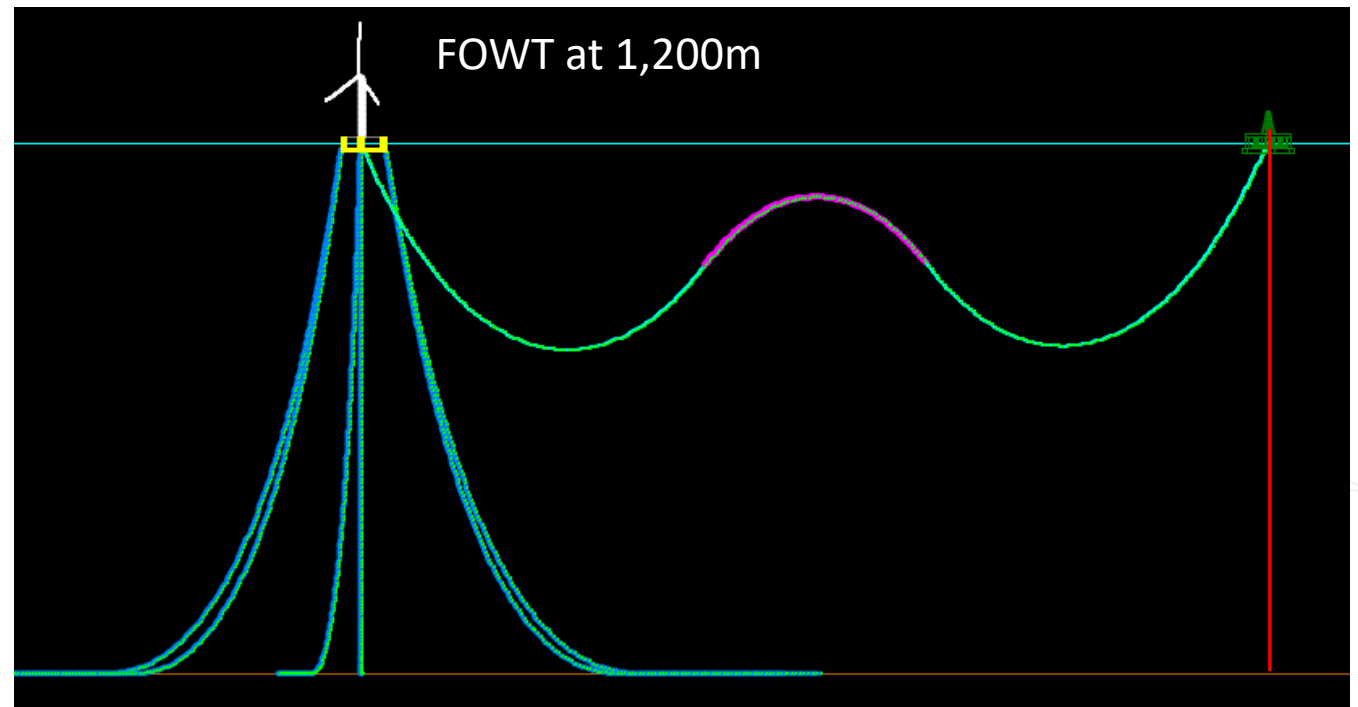

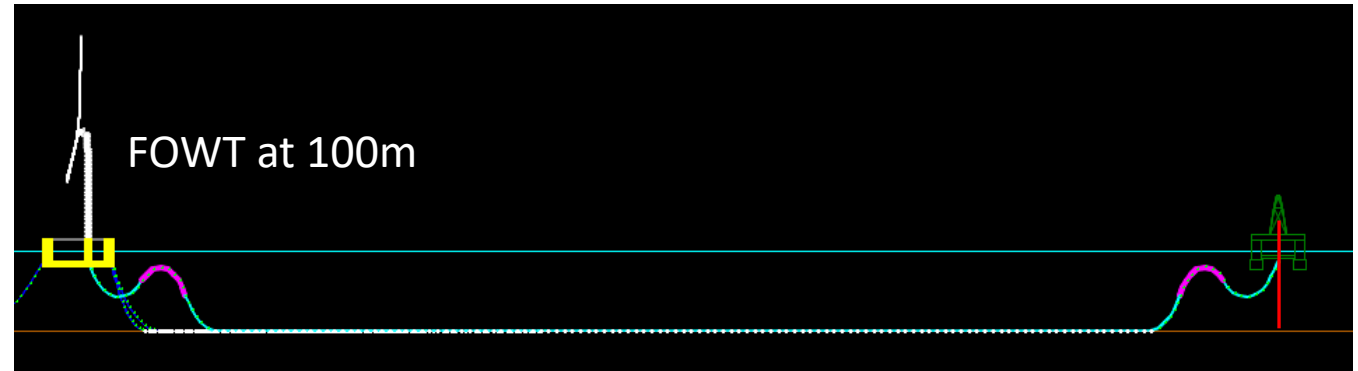

- Funded by Canadian government
- Led by Waterford Energy Services Inc. (WESI)
 - Economic and logistical feasibility
- 2H Offshore
 - FOWT mooring Design
- 2 Target Oil & Gas Fields
 - Grand Banks (100m)
 - Flemish Pass (1,200m)

Mobile FOWT Design Challenges

- Drillship is to relocate to a new well location at every 6 to 12 months
- The water depth can change anywhere from 100m to 1,200m in the field
- Mooring design should work at every possible water depth in the field
- Mooring and anchor component sizes are to remain unchanged regardless of water depth
- Modular mooring segments to facilitate mooring length adjustment based on water depth

Mooring Design Premise

- Design Load Cases
 - 50yr extreme storm (DnV DLC 6.2 - Parked)
 - Operational at rated and cut-out wind speeds with severe sea state (DnV DLC 1.6)
 - Packed ice condition (DnV DLC 9.1)
 - 1,000kN in Surge
 - 300kN in Sway

| Site | Storm Condition | Hs | Tp | y | Wind Speed | | Surface Current | Seabed Current |
|--------------|-----------------|-------|-------|------|--------------------|-----------------|-----------------|----------------|
| | | m | s | | m/s | | m/s | m/s |
| Grand Banks | 1yr | 8.04 | 12.37 | 2.08 | 10.59 ¹ | 28 ² | 0.25 | 0.1 |
| | 50yr | 14.32 | 15.6 | 2.74 | 32.51 | | 1.2 | 0.4 |
| Flemish Pass | 1yr | 8.93 | 13 | 2.11 | 10.59 ¹ | 28 ² | 0.3 | 0.1 |
| | 50yr | 15.2 | 16.04 | 2.77 | 34.73 | | 1.4 | 0.3 |

1/ Max thrust wind speed

2/ Cut-out wind speed

Mooring Design Premise

- NREL's 15MW WTG
- VoltturnUS Concrete Floater by Univ of Maine
- 6-Line Chain Catenary Mooring
 - Redundancy in case of mooring failure due to oil & gas facilities
 - Robustness for handling and multiple installation and retrieval
- DnV-ST-0119 Consequence Class-1 (Redundant)
 - Target Strength Utilization <0.95

| Limit State | Consequence Class 1 Load Factors | |
|------------------------------|----------------------------------|-----------|
| | Y_{mean} | Y_{dyn} |
| Ultimate Limit State (ULS) | 1.3 | 1.75 |
| Accidental Limit State (ALS) | 1.0 | 1.10 |

Mooring Configuration at Grand Banks (100m)

- 6 mooring line spread system:
 - 3 clusters at 120°, lines 10° apart within cluster
- 84mm R5 Chain
- MBL: 7,742kN (includes 4mm corrosion)
- Min Chain Length: 650m

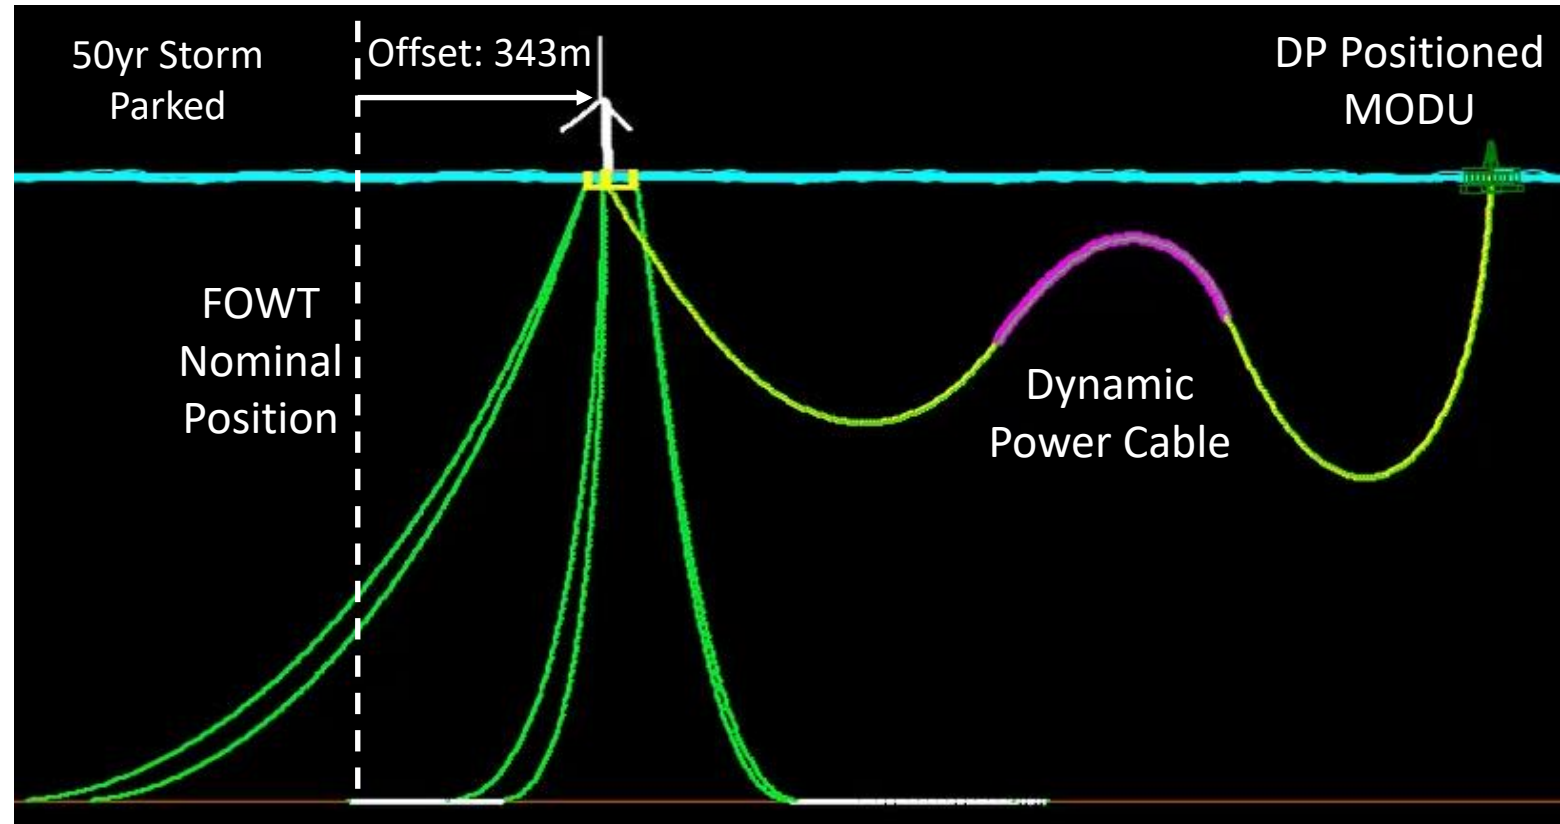

| Configuration | Chain Size | Top Angle | Pre-tension | Max Offset | Strength Utilization | Max Tension | Chain MBL | Required Chain Length |
|-----------------------|------------|-----------|-------------|-------------|----------------------|----------------|----------------|-----------------------|
| | mm | ° | % MBL | m | - | kN | kN | m |
| 6ML – Config 1 | 150 | 50 | 6% | 15.3 | 42% | 5,884.3 | 21,789.0 | 482.5 |
| 6ML – Config 2 | 124 | 50 | 6% | 17.2 | 54% | 5,433.2 | 15,852.0 | 552.9 |
| 6ML – Config 3 | 94 | 50 | 6% | 20.4 | 81% | 4,877.7 | 9,539.0 | 653.4 |
| 6ML – Config 4 | 84 | 50 | 6% | 21.3 | 102% | 4,996.3 | 7,742.0 | 683.5 |
| 6ML – Config 5 | 94 | 30 | 3% | 34.9 | 72% | 4,346.9 | 9,539.0 | 610.0 |
| 6ML – Config 6 | 84 | 30 | 3% | 35.9 | 90% | 4,401.8 | 7,742.0 | 650.0 |

Mooring Configuration at Flemish Pass (1,200m)

- 6 mooring line spread system:
 - 3 clusters at 120°, lines 10° apart within cluster
- 84mm R5 Chain
- MBL: 7,742kN (4mm corrosion)
- Anchor Radius: 1,250m
- Min Chain Length: 2,000m
- Chain Segments: 250m to 500m

| Configuration | Chain Size | Top Angle | Pre-Tension | Strength Utilization | Max Tension | Chain MBL |
|-----------------------|------------|-----------|-------------|----------------------|---------------|---------------|
| | mm | ° | % MBL | | kN | kN |
| 6ML - Config 1 | 124 | 10 | 26% | 60% | 6624.5 | 15483.0 |
| 6ML - Config 2 | 84 | 10 | 26% | 87% | 4483.0 | 7537.0 |
| 6ML - Config 3 | 74 | 10 | 26% | 100% | 4051.7 | 5927.6 |
| 6ML - Config 4 | 78 | 10 | 26% | 95% | 4247.2 | 6549.2 |

Key Takeaways

- The government of Canada set a price on carbon pollution (carbon tax) targeting GHG emission reduction of 30% below 2005 levels by 2030.
- FOWTs can reduce MODU's CO₂ emissions and fuel costs by 83% or more based on the BESS capacity providing annual savings of over \$20 million.
- Robust and mobile mooring system can be designed for FOWTs considering local environmental conditions and water depths.
- Redundant mooring system can ensure the safety of oil & gas facilities even with failed mooring lines.
- Power cables can be suspended in water column for deep waters or laid on the seabed for shallow waters.
- The concept is being advanced for larger emitters in the offshore Oil and Gas industry. We expect this technology to be employed by 2030 in Atlantic Canada; Oil and Gas Production will exist beyond 2050 however, associated emissions will be curtailed significantly

Thank You
